Regenerative AC Electronic Load

EL+ vAC is a 4Q programmable AC Current Source designed to emulate the electrical behaviour of passive and active devices connected to the grid. This cost-effective solution is specially suitable for testing AC sources, UPS and EV Charging Infrastructure. Its Regenerative Hardware allows a reduction in the total power and energy needed for the test.

## Regenerative Technology

Thanks to our bi-directional topology, the AC Electronic Load Converter are regenerative, resulting in a reduction of both the consumed energy during the tests and the power required from the electrical installation.

This technology allows us to work in both directions, as power generators or offering a consumption for the realization of all types of tests.

## Main Applications

Electromobility

Smart Grids

Avionics

Academical & Industrial Test

## Bidirectional and Regenerative

### Clean grid current

THDi <3% and PF > 0.98

### 13 Models

from 7.5kW to 160kW

### Parallelization of units to increase the power

### Independent phase configuration of

rms current, phase angle, harmonics, interharmonics, generation of fast transients ("Current Dips")

AC

## Overload of 200% P<sub>rated</sub>

### Emulation of grid connected devices

Loads absorbing energy from grid  
Generators injecting energy to the grid  
Programmable Active/Reactive consumption  
Non-linear currents up to CF of 3

### Modbus/Ethernet Open protocol, Labview drivers

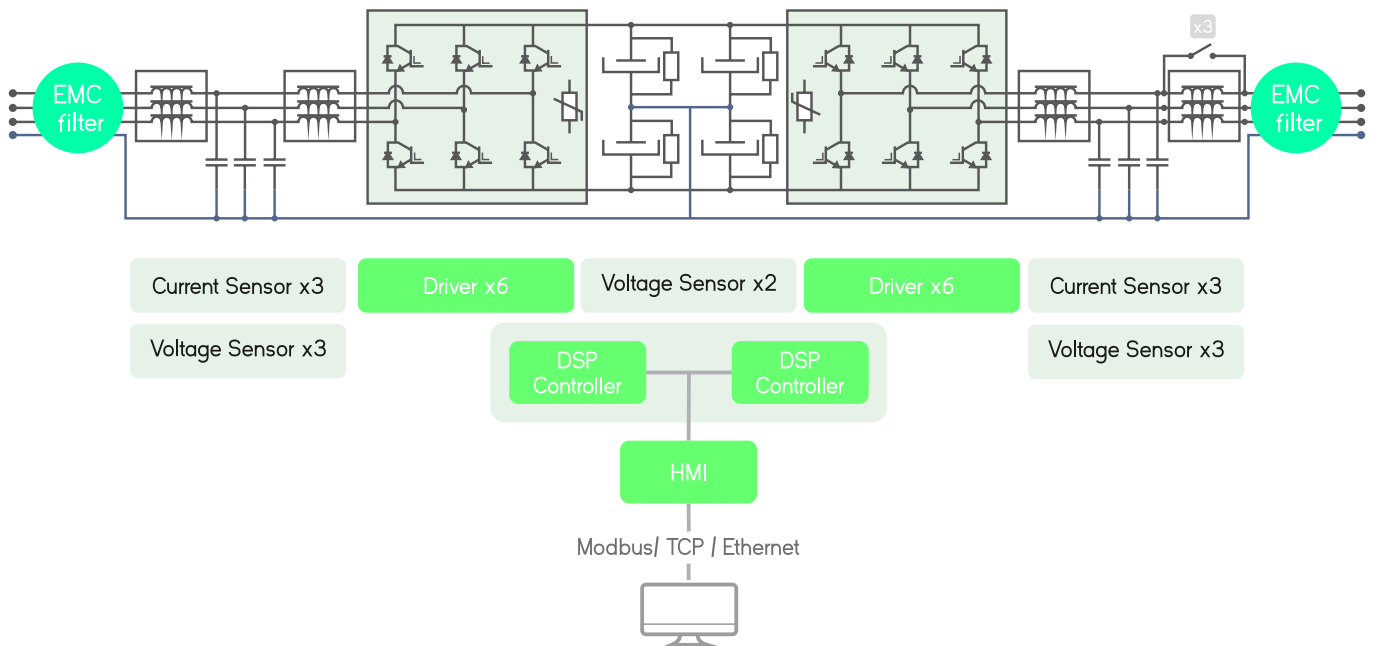

# Bidirectional and Regenerative Hardware

The hardware platform is based on a Back-to-Back power conversion topology, formed by two IGBT-based power stages. The grid side stage is an Active Rectifier which produces clean sinusoidal currents with very low harmonic distortion and power factor close to one.

The EUT side stage can be configured for AC voltage source or AC current source or DC output. In AC, voltage/current are controlled by using state of the art digital Proportional-Resonant controllers. In DC, the three independent buck-boost bidirectional legs enable the separated control of three different DC voltages or currents.

## Block Diagram

## Local Interface

### Analogue and Digital IO ports

The isolated digital and analogue inputs/outputs permit the connection of the unit to External Controllers and Power Hardware in the Loop systems (option).

### 4.3" Touchscreen

Allows the local parameterization and command of the device, configuration of the communications link, plots the main signals and enables the local datalogging.

### Safety First

The units integrate a local Emergency Stop pushbutton and two signals (input+ output) to be connected to the laboratory interlock system. Additionally, the digital outputs can be interfaced to safety tower lights.

### Master/Slave

ePLUS is a modular platform enabling the master/slave connection of units with equal power.

# Better than ever, the enhanced **Plus** family

## What's better

### MASTER/SLAVE CONNECTION

by using a fiber optics link to increase power/voltage capabilities:

GE in AC: can be connected in parallel

EL in AC: can be connected in parallel

B2C: can be connected in parallel, or series or both

### FASTER

30kHz control loop frequency

### MORE HARMONICS

50 per phase with 20 free-harmonics

### DELTA LOAD

for the EL in AC mode

### ADJUSTABLE DC TRANSIENT

controllers to improve stability of the system

### OPTIMIZED RMS CALCULATION

for PV inverters anti-islanding test

### SAME ELECTRICAL RATINGS

#### and SAME BANDWIDTH

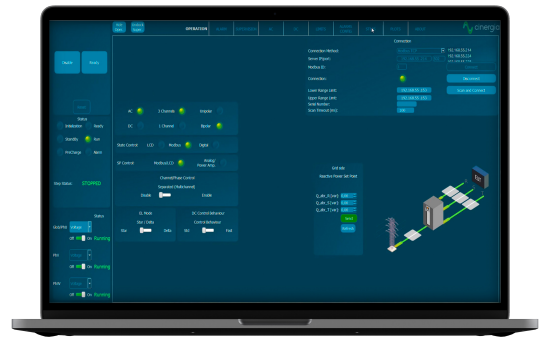

because the power platform does not change so robustness and ratings remain the same.

# Software

The user interface used by CINERGIA devices has been developed by our R&D team, to offer total control of the device, with a comfortable and intuitive design. This allows us to take full advantage of the capabilities of the device, as well as the programming and execution of standardized or self-created tests.

## EL Modes

### AC Operation

From this panel, the user can set all AC parameters. Each phase can be independently configured: RMS current magnitude, phase delay, harmonics content, free-frequency harmonic and transition ramps. A plot shows the expected real-time waveform, the FFT representation and the numeric data: RMS, peak, CF and THD.

### Harmonics

The device can control simultaneously the magnitude of the first 15 harmonics and one free harmonic per phase. The free one allows the generation of sub-harmonics, inter-harmonics and high frequency harmonics up to the 50th, setting both the magnitude and phase delay.

### Power and Impedance Control

In Power mode, the active and reactive power of each phase is independently controlled. In Impedance mode, the device emulates an RLC load allowing to parameterize resistance, inductance and capacitance per phase making this device suitable for Anti-Islanding test of grid converters.

## AC

### Steps Mode

One of the most remarkable novelties of the new software is the steps functionality. Step test files are saved and executed by the DSP allowing deterministic timing with a resolution of 66µs. The user gains access to all registers of the device to create complex test sequences which run directly in the converter without the need of an external computer.

### Disturbance Generation

The steps mode includes predefined easy-to-use test panels. The AC faults panel is a powerful yet intuitive editor which allows generating and configuring flicker. Specific profiles can be saved in .csv files, modified, and reused by importing an existing one.

### Linear & Non-Linear Emulation

The capacity to emulate linear and non-linear loads in one of the main features of the 4Q Electronic Load. Through our intuitive control software, the magnitude of harmonics can be set and different types of loads can be generated.

## Options

Choose your options:

- Galvanic Isolation
- Three channel mode: allows different operation mode start/stop/reset per channel (included in all models from 7.5 to 60, both included)
- 30kHz Switching Frequency: only available for models 15 (derated to 7.5kW), 20 (derated to 7.5kW) and 30 (derated to 10kW)
- Isolation monitor (advised for IT systems)
- Low current ripple inductance (included in all models ≤54kW. optional for models ≥80kW)
- High Frequency 360 - 900Hz
- Anti-islanding monitor (only advised in net injection to the grid and following local regulations)
- High Voltage (HV): voltage up to 295Vrms phase-neutral in AC up to 800V in DC
- RS485

All specifications are subject to change without notice.

1. Minimum voltage setpoint is 0V in DC. The recommended minimum setpoint for long-term use is 20Vrms in AC and 20V in DC.
2. Effective resolution measured with a 400ms window
3. FS Range of voltage is 830V (with High Voltage option)  
FS Range of current is  $2 \cdot |3 \cdot I_{rated}|$  (see models table)  
FS Range of power is  $2 \cdot |200\% \cdot Prated|$  (see models table)
4. Accuracies are valid for settings above 10% of FS
5. Measured with the rated resistive load and high-dynamics controllers configuration.
6. Accuracy of measurements is  $\pm 0.1\%$  of FS for rms voltage,  $\pm 0.2\%$  of FS for rms current,  $\pm 0.4\%$  of FS for active power (valid only above 10% of FS)
7. Consult us for lower voltage/current ripple requirements
8. Rated power figures are given at 20°C
9. The maximum output voltage depends on frequency following  $V \cdot f < 46000$
10. With fast DC control behaviour
